

Stack

91. Write a C program to implement a stack using an array and perform the basic operations:
 - a. Push
 - b. Pop
 - c. Display the stack.
92. Write a program to implement the Push operation in a stack and handle the stack overflow condition.
93. Write a program to implement the Pop operation in a stack and handle the stack underflow condition.
94. Write functions to check whether a stack is full or empty using `isFull()` and `isEmpty()` operations.
95. Write a C program to implement stack using a structure and perform push and pop operations.
96. Write a recursive program to calculate the factorial of a number and explain how the stack is used during function calls.
97. Trace the stack operations when the elements A, B, C, D, E are pushed into a stack and two elements are popped. Show the stack after each operation.
98. Write a program to display all elements of the stack from top to bottom.
99. Write a program to delete the middle element of a stack. Assume data by yourself and your solutions should work for any test cases.
100. Write a menu-driven program for stack operations that allows the user to:
 - A. Push an element
 - B. Pop an element
 - C. Check if stack is full
 - D. Check if stack is empty
 - E. Display the stack.
